-
- 1.1 Scope**
- The EV12AS200ZPY-EB Evaluation Kit is designed to facilitate the evaluation and characterization of the EV12AS200 12-bit 1.5 GSps ADC in AC coupled mode.
- The EV12AS200ZPY-EB Evaluation Kit includes:
- The 12-bit 1.5 GSps ADC Evaluation board including EV12AS200ZPY and μ controller "CYPRESS" high-speed USB peripheral controller soldered.
 - A CD ROM with the datasheet, present user guide and software tools necessary to use the SPI.
 - A cable for connection to the mini USB port.
- The user guide uses the EV12AS200ZPY-EB Evaluation Kit as an evaluation and demonstration platform and provides guidelines for its proper use.
-
- 1.2 Description**
- The EV12AS200ZPY-EB Evaluation board is very straightforward as it implements e2v EV12AS200 12-bit 1.5 GSps ADC device, SMA connectors for the sampling clock, analogue inputs and reset input accesses and 2.54 mm pitch connectors compatible with high speed acquisition system probes.
- Thanks to its user-friendly interface, the EV12AS200ZPY-EB Kit enables to test all the functions of the EV12AS200ZPY 12-bit 1.5 GSps ADC.
- To achieve optimal performance, the EV12AS200ZPY-EB Evaluation board was designed in a 6-metal-layer board using FR4 HTG epoxy dielectric material (200 μ m, ISOLA IS410 featuring a resin content of 45%). The board implements the following devices:
- The 12-bit 1.5 GSps ADC Evaluation board with the EV12AS200ZPY ADC soldered.
 - SMA connectors for CLK, CLKN, VIN, VINN, SYNC and SYNCN signals.
 - SMA connectors for calibration lines.
 - 2.54 mm pitch connectors for the digital outputs, compatible with high speed acquisition system probes.
 - Banana jacks (2 mm) for the power supply accesses, the Die junction Temperature monitoring functions.
 - Jumpers for SDAEN, SDA, RS, TM, SA, OA, GA, Mode_n.

- Potentiometers for SA, OA, GA, SDA.
- Mini USB port.

Figure 1-1. EV12AS200ZPY-EB Evaluation Board

The board dimensions are 260 mm x 210 mm.
The board comes fully assembled and tested, with the EV12AS200 installed.

Figure 1-2. EV12AS200ZPY-EB Evaluation Board Simplified Schematic

As shown in Figure 1-1, different power supplies are required:

- $V_{CC5} = 5.2V$ analogue positive power supply (referenced to AGND)
- $V_{CC3} = 3.3V$ analogue positive power supply (referenced to AGND)
- $V_{CC0} = 2.5V$ digital output power supply (referenced to DGND)
- 3.3V board supply for control functions (referenced to DGND)
- 5V by mini USB port

Hardware Description

2.1 Board Structure

In order to achieve optimum full speed operation of the EV12AS200 12-bit 1.5 GSps ADC, a multi-layer board structure was retained for the evaluation board. Six copper layers are used, dedicated to the signal traces, ground planes and power supply planes.

The board is made in FR4 HTG epoxy dielectric material (ISOLA IS410).

Board characteristics:

- RO4003 for the top and bottom layers, FR4 HTG for the internal layers
- Dielectric thickness: 200 μm
- Dielectric constant: 3.38
- Lands diameter: 750 μm
- GND Via/Land Diameter: 200 μm

Construction:

The following table gives a detailed description of the board's structure.

Table 2-1. Board Layer Thickness Profile

Layer	Characteristics
Layer 1 Copper layer	Copper thickness = 40 μm (with NiAu finish) AC signals traces = 50 Ω microstrip lines DC signals traces
FR4 HTG / dielectric layer	Layer thickness = 200 μm
Layer 2 Copper layer	Copper thickness = 18 μm AGND, DGND (separate planes)
FR4 HTG / dielectric layer	Layer thickness = 349 μm
Layer 3 Copper layer	Copper thickness = 18 μm Power planes = V_{CC5} , V_{CC3} , V_{CC0} , 3V3 USB
FR4 HTG / dielectric layer	Layer thickness = 350 μm
Layer 4 Copper layer	Copper thickness = 18 μm Power planes = 3V3
FR4 HTG / dielectric layer	Layer thickness = 350 μm
Layer 5 Copper layer	Copper thickness = 18 μm AGND, DGND (separate planes)
FR4 HTG / dielectric layer	Layer thickness = 200 μm
Layer 6 Copper layer	Copper thickness = 40 μm (with NiAu finish) AC signals traces = 50 Ω microstrip lines DC signals traces

The board is 1.6 mm thick.

The Clock, analogue inputs, reset and ADC functions occupy the top metal layer. The digital data output signals occupy the top and bottom layers.

The Ground planes occupy layer 2 and 5.

Layer 3 and 4 are dedicated to the power supplies.

2.2 Analogue Inputs/Clock Input

The differential clock and analogue inputs are provided by SMA connectors (Reference: JOHNSON 142-0701-851-6).

Both pairs are AC coupled using 10 nF capacitors.

Special care was taken for the routing of the analog and clock input signals for optimum performance in the high frequency domain:

- 50 Ω lines matched to ± 0.1 mm (in length) between VIN and VINN or CLK and CLKN.
- 1270 μm between two differential pairs.
- 400 μm line width.
- 40 μm thickness.
- 870 μm diameter hole in the ground layer below the VIN and VINN or CLK and CLKN ball footprints.

- In addition, the lines for VIN, VINN and CLK, CLKN are matched to one another within $\pm 1\text{mm}$.
- A clearance in the ground plane below the CLK, CLKN and VIN, VINN package lands is necessary.

Note: These values have been calculated with RO4003 dielectric material.

Figure 2-1. Board Layout for the Differential Analog and Clock Inputs with RO4003

Note: The analogue inputs and clock inputs are AC coupled with 10 nF very close to the SMA connectors.

2.3 Digital Output Data

The high speed differential output signals (digital output, clock output), are routed in parallel with 50 ohm impedance, 370 μm width and a pitch of 0.77 mm.

Max difference between any two signals = $\pm 1.5\text{mm}$.

Max difference between longest and shortest data per port = $\pm 1\text{mm}$.

Max difference between two signals of the same differential pair (X_i, X_{iN}) = $\pm 0.5\text{mm}$ (where $X = A$ and B , $i = 0 \dots 9$).

Note: These values have been calculated with RO4003 dielectric material.

Figure 2-2. Recommended Routing on RO4003 for Digital Output Data Signals

2.4 SYNC, SYNCN

A power up reset ensures that the first digitized data corresponds to the first acquisition. An external differential LVDS Reset (SYNC, SYNCN) can also be used. RES function allows changing the active edge of the RESET signal.

The differential reset inputs SYNC, SYNCN are provided by SMA connectors (Reference: VITELEC 142-0701-8511). The signals are AC coupled.

- 50 Ω lines matched to $\pm 0.1\text{mm}$ (in length) between SYNCN and SYNCN
- 1270 μm between two differential pairs
- 400 μm line width
- 40 μm thickness
- 870 μm diameter hole in the ground layer below SYNC, SYNCN ball footprints

Figure 2-3. Recommended Routing on RO4003 for RSTN Signal

2.5 RS, TM, SDA, SDAEN, GA, OA, SA, RESETN, MODE_n, Diode and CMIRef

These are "static" signals. They are routed in single-ended 50 ohm impedance.

Figure 2-4. Recommended Routing on RO4003 for static Signal

2.6 Ground Layers

There are 2 separated planes for the AGND and the DGND on the PCB. These planes must be reunited via 0Ω resistors. Only the input clock and analogue input are referenced to AGND, the other parts of the ADC are referenced to DGND.

2.7 Power Supplies

Layers 3 and 4 are dedicated to power supply planes:

V_{CC5} : ADC Analog part supply ($V_{CC5} = 5.2V$)

V_{CC3} : ADC Analogue Core and Digital parts supply ($V_{CC3} = 3.3V$)

V_{CC0} : ADC Output buffers supply ($V_{CC0} = 2.5V$)

3.3V: external reference for GA, OA, SA and SDA commands.

5V by mini USB port: SPI.

The supply traces are low impedance and are surrounded by two ground planes (layer 2 and 5).

Each incoming power supply is bypassed at the banana jack by a 1 μF Tantalum capacitor in parallel with a 100 nF chip capacitor.

Each power supply is decoupled as close as possible to the EV12AS200ZPY device by 10 nF in parallel with 100 pF surface mount chip capacitors.

Note: The decoupling capacitors are superimposed with the 100 pF capacitor mounted first.

Operating Characteristics

-
- 3.1 Introduction** This section describes a typical configuration for operating the evaluation board of the EV12AS200ZPY 12-bit 1.5 GSps ADC.
- The analogue input signals and the sampling clock signal should be accessed in a differential fashion. Band pass filters should also be used to optimize the performance of the ADC both on the analog input and on the clock.
- It is necessary to use a very low jitter source for the clock signal (better than 100fsrms jitter).

Note: 1. The analogue inputs and clock are AC coupled on the board.

-
- 3.2 Operating Procedure**
1. Begin by installed **Setup_EV12AS200.exe** file on your system.
 2. Connect mini USB port. (red led switch on)
 3. Connect the power supplies and ground accesses through the dedicated banana jacks. $V_{CC5} = 5.2V$, $V_{CC3} = 3.3V$, $V_{CC0} = 2.5V$, board supply = 3.3V.
 4. Connect the clock input signals.
The clock input level is typically +4dBm on ADC input (if you use balun or filter take into account the losses in the chain of measure).
The clock frequency should be set to 1.5 GHz.
 5. Connect the analogue input signals (the board has been designed to allow only AC coupled analogue inputs).
Use a low-phase noise High Frequency generator as well as a band pass filter to optimize the analogue input performance.
The analogue input Full Scale is 500mV peak-to-peak around zero (analogue input providing the Input common mode).
 6. Connect the high speed acquisition system probes to the output connectors.
The digital data are differentially terminated on-board (100Ω) however, they can be probed either in differential.
 7. Switch on the ADC power supplies (recommended power up sequence: simultaneous or in the following order: $V_{CC3} = 3.3V$, $V_{CC5} = 5.2V$, $V_{CC0} = 2.5V$, board supply 3.3V).
 8. Turn on the RF clock generator.
 9. Turn on the RF signal generator.

The EV12AS200ZPY-EB evaluation board is now ready for operation.

3.3 Electrical Characteristics Values in the table below are given for information only. For more accurate values, please refer to the device datasheet.

Table 3-1. Recommended Conditions of Use

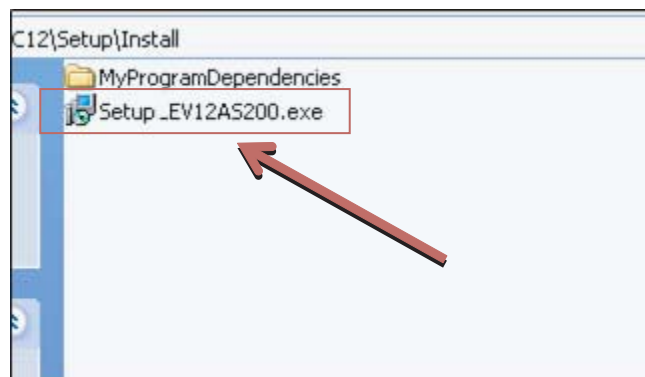

Parameter	Symbol	Comments	Typ	Unit
Power supplies	V _{CC5}		5.2	V
	V _{CC3}		3.3	V
	V _{CC0}		2.5	V
Differential analog input voltage (Full Scale)	V _{IN} - V _{INN}	100Ω differential	500	mVpp
Clock input power level (Ground common mode)	P _{CLK} P _{CLKN}	100Ω differential input	+4	dBm
Operating Temperature Range	T _c T _j	Commercial "C" grade Industrial "V" grade	T _c > 0°C ; T _j < 90°C T _c > -40°C ; T _j < 110°C	°C

Table 3-2. Electrical Characteristics

Parameter	Symbol	Min	Typ	Max	Unit
RESOLUTION			12		bit
POWER REQUIREMENTS					
Power Supply voltage					
- Analogue	VCC5	5	5.2	5.5	V
- Analogue Core and Digital	VCC3	3.15	3.3	3.45	V
- Output buffers	VCC0	2.4	2.5	2.6	V
Power Supply current in 1:1 DEMUX Ratio			197		
- Analogue	I_VCC5		574		mA
- Analogue Core and Digital	I_VCC3		109		mA
- Output buffers	I_VCC0				mA
Power Supply current in 1:2 DEMUX Ratio			197		
- Analogue	I_VCC5		570		mA
- Analogue Core and Digital	I_VCC3		66		mA
- Output buffers	I_VCC0				mA

-
- 4.1 Overview** The EV12AS200ZPY-EB Evaluation user interface software is a Visual C++ compiled graphical interface that does not require a licence to run on a Windows NT and Windows 2000/98/XP/Seven PC.
- The software uses intuitive push-buttons and pop-up menus to write data from the hardware.
-
- 4.2 Getting Started** This section will guide you step by step through installation process of EV12AS200 application.
- Installation process is available on Microsoft operating system from Windows 2000 to Windows Seven. Only 32bits operating system is currently supported.
- Begin by locating **Setup_EV12AS200.exe** file on your system, and launch it.

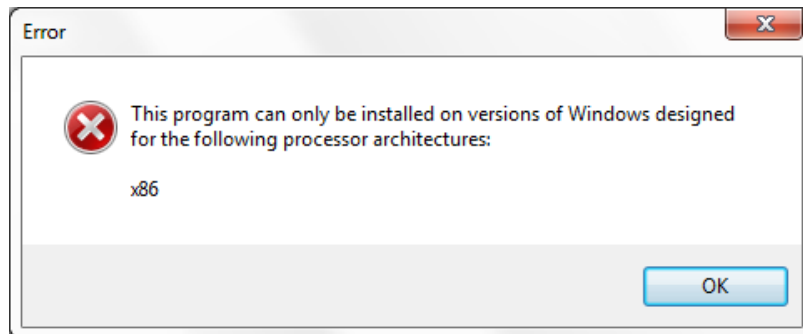

Figure 4-1. Install Window

Setup required administrative privilege execution. If you don't have such right, please, contact your IT manager.

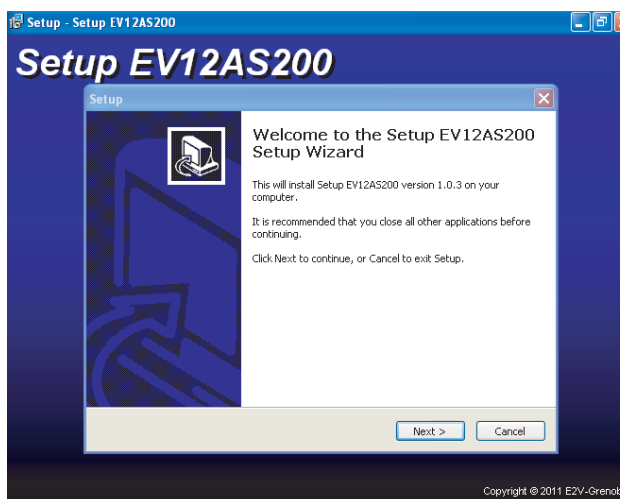

On recent operating system, a warning message is shown regarding higher privilege require. Answer **Yes**, otherwise setup will stop.

If your operating systems not 32bits, the following message will be display.

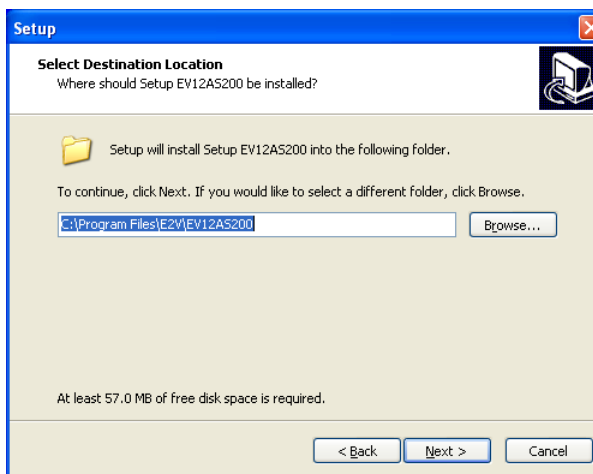

Setup process will start with this first information screen.
 Click on **Next** to step to the next screen.

Figure 4-2. EV12AS200 Application Setup Wizard Window

This dialog displays destination directory of application. Change it to your convenience, or choose it by clicking on **Next** button.

Figure 4-3. EV12AS200 Select Destination Directory Window

Next dialog displays Start Menu entry to store application shortcut. Change it to your convenience, or choose it by clicking on **Next** button.

Figure 4-4. EV12AS200 Select Start Menu Window

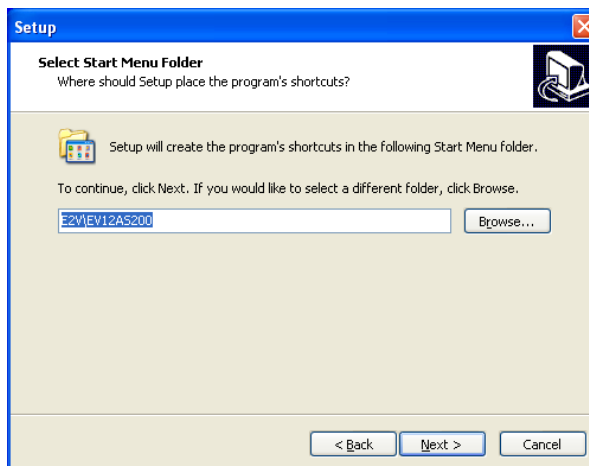

Figure 4-5. EV12AS200 Select Additional Tasks Window

Next dialog asks you if you want an application shortcut on your desktop. Change it to your convenience, or choose it by clicking on **Next** button.

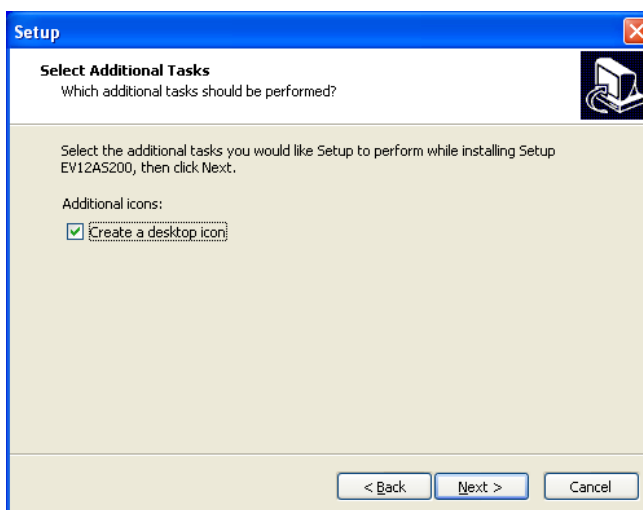

Figure 4-6. EV12AS200 Ready To Install Window

Next dialog shows a resume about operations setup will perform to complete installation. If you're agreeing, click on **Install** to start it.

Several dialogs will be show according tasks to do.

If you agree with the install configuration, press Install button.

Figure 4-7. EV12AS200 Application Setup *Install* Push Button

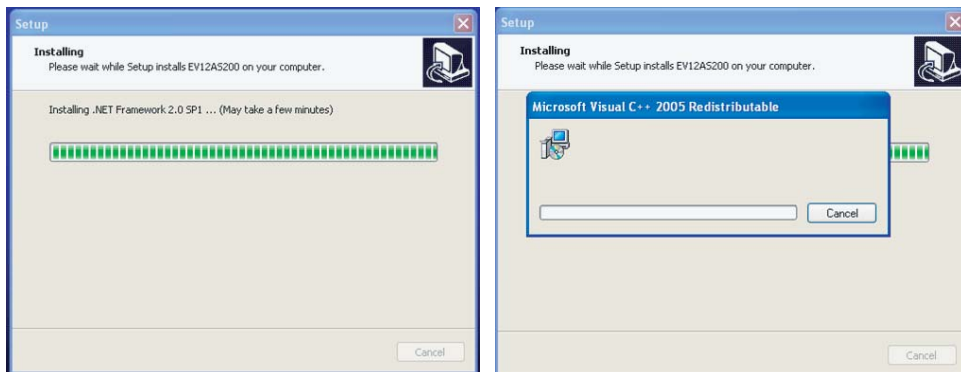

The installation of the software is now complete.

Figure 4-8. EV12AS200 Setup Window

Microsoft Visual C++ 2005 Redistributable may take times to complete. Please, be patient.

A black window may appear shortly. It's normal, and is part of installation process.

When all tasks are done, the following dialog appears.

If you wish to start application now, you should plug your device on any USB port of your workstation, and follow driver installation process. Otherwise, EV12AS200 application will claim no device is connected.

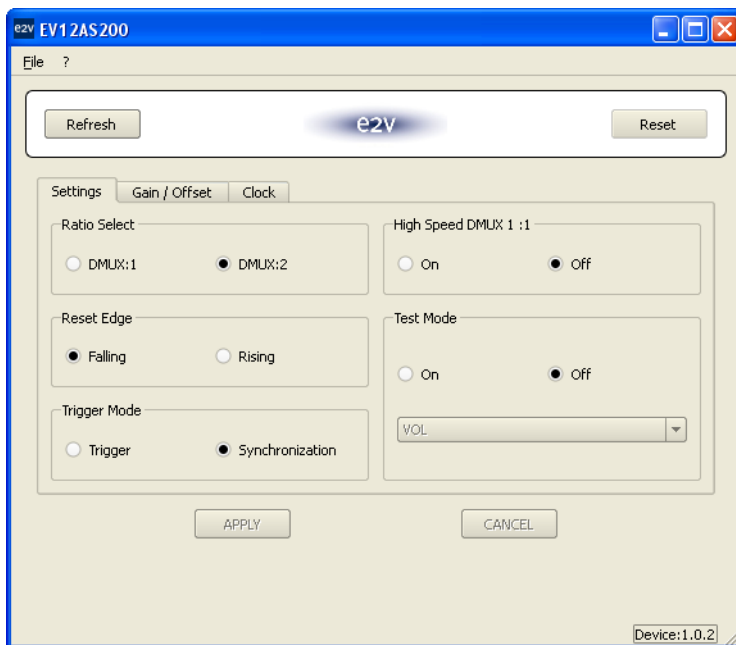

Figure 4-9. EV12AS200 Completing Setup Wizard Window

Setup is now completed successfully. After the installation,

You can launch the interface with the following file:

C:\Program Files\ev2v\Setup_EV12AS200.exe or you can click "icon" on desk top. The window shown in Figure 4-9 will be displayed.

Figure 4-10. EV12AS200 User Interface Window

4.3 Troubleshooting

1. Check that you own rights to write in the directory
2. Check for the available disk space
3. Check that at least one mini USB port is free and properly configured
4. Check that all supplies are properly powered on

Figure 4-11. EV12AS200 User Interface Hardware Implementation

1. Use an mini USB port to send data to the ADC.
2. Connect the crossed mini USB cable between your PC and your evaluation board.
3. Mode_n activated: JUMPER ON. (if no connected, use functionalities commands on board).

4.4 Operating Modes

The EV12AS200 software included with the evaluation board provides a graphical user interface to configure the ADC.

Push buttons, popup menus and capture windows allows easy:

1. Settings
2. Gain / Offset
3. Clock

"Apply" button is not available. All functionalities are directly applied.

"Apply" button is not available.

"Reset" button allows reconfiguring ADC to Default Mode.

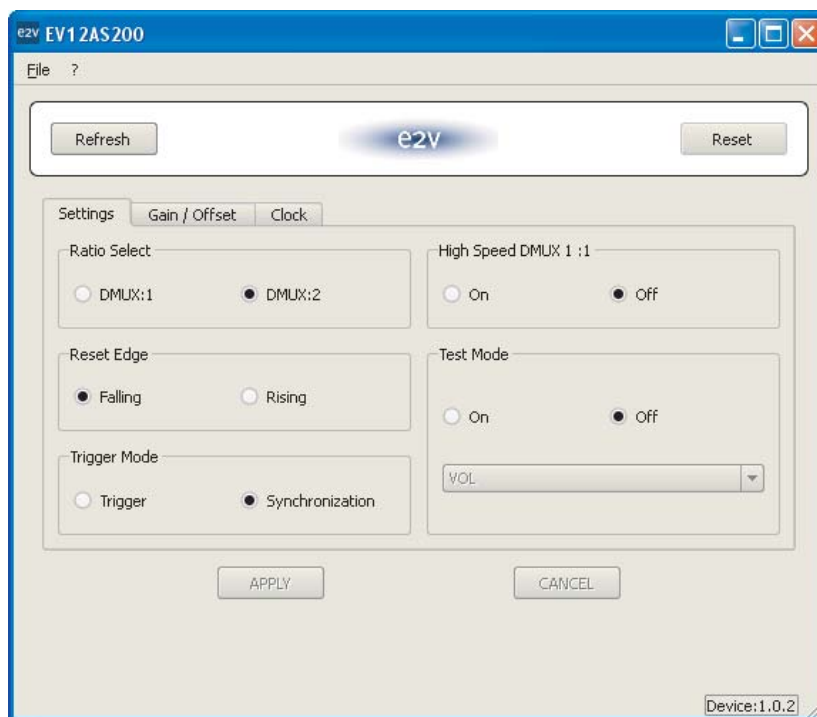

"Reset" button allows checking ADC Mode.

4.4.1 Settings mode

Figure 4-12. Settings

In this window, six functions are available:

■ **Ratio Select**

Two Demux Ratios can be selected. "Default value : DMUX1:2"

1:1 DMUX => Data only port A (Data0, Data1, Data2,.....)

1:2 DMUX => Data port A (Data0, Data2, Data4,.....)

Data port B (Data1, Data3,.....)

Figure 4-13. Ratio Select

■ **High Speed DMUX 1:1**

When "HSD" is set to "On", power consumption will slightly increase in order to allow for 1GSps operation in DMUX 1:1. "Default value: functionality => off"

Figure 4-14. High Speed Demux 1:1

■ **Test mode**

Default value: functionality => off

When "Test mode" is set to "On", three possibilities are available for data output:

All datas to VOL

All datas to VOH

Align pattern: Basic sequence of 16 cycles of output data rate.

Figure 4-15. Test Mode

■ Reset Edge

This function allows changing the active edge of the SYNC signal. "Default value: functionality => Falling"

Figure 4-16. Reset Edge

■ Trigger Mode

This function allows to help synchronise multiple ADCs. "Default value: functionality => Synchronization"

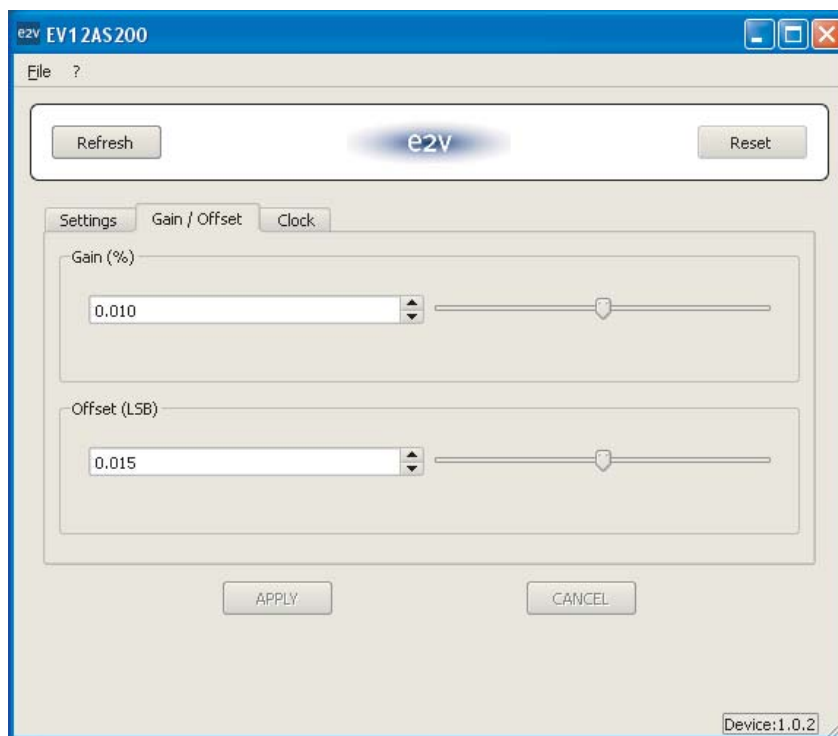

Figure 4-17. Trigger Mode

4.4.2 Gain / Offset

In this window, you can adjust the gain and offset.

Figure 4-18. Gain / Offset

■ Gain

This function allows adjusting ADC Gain so that it can always be tuned to 1.0

The ADC Gain can be tuned by $\pm 10\%$ by tuning the voltage applied on GA by $\pm 0.5V$ around $2 \cdot V_{cc3}/3$.

The step is 0.8LSB

Figure 4-19. Gain Initial

■ **Offset**

This function allows adjusting ADC Offset so that it can always be tuned to mid-code 2048.

The ADC Offset can be tuned by ± 195 LSB (± 23.8 mV) by tuning the voltage applied on OA by $\pm 0.5V$ around $2 \cdot V_{cc3}/3$.

$2 \cdot V_{cc3}/3 + 0.5V$ gives the most negative offset variation and $2 \cdot V_{cc3}/3 - 0.5V$ gives the most positive offset variation

The ADC offset can be tuned by ± 195 LSB by step of 0.38LSB.

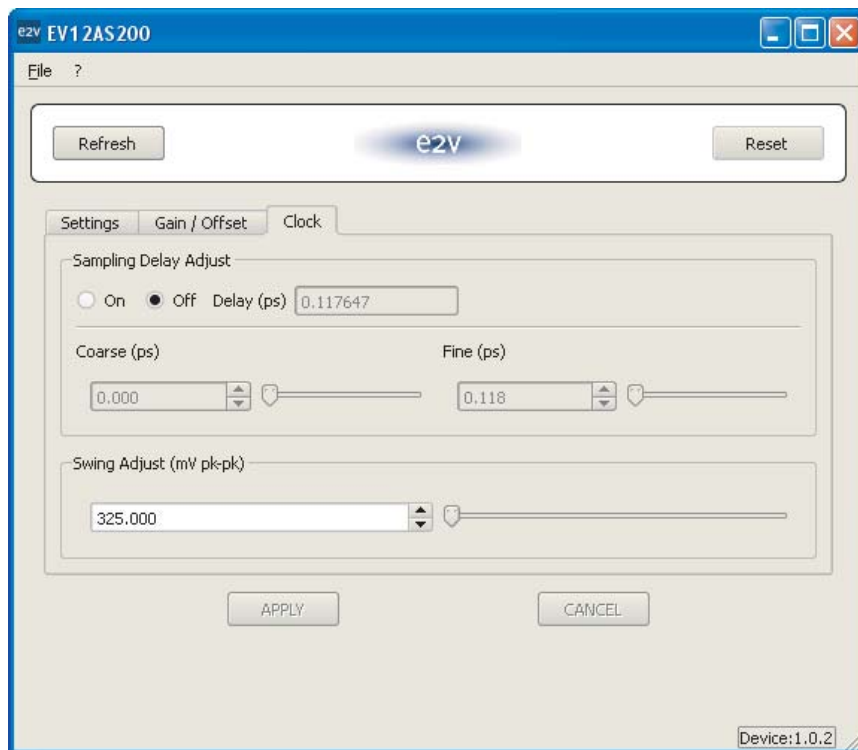

Figure 4-20. Offset Initial

4.4.3 Clock

In this window, you can adjust sampling delay and swing.

Figure 4-21. Clock

■ Sampling delay adjust

Sampling delay adjust (SDA pin) allows to tune the sampling ADC aperture delay (TA) around its nominal value.

This feature is particularly interesting for interleaving ADCs to increase sampling rate

Default value: functionality: Off

Figure 4-22. SDA Enable

Total SDA delay is given by SDA coarse value in addition to SDA fine value.
(case 6 -> delay)

SDA coarse register [1:0] allows a variation step of 0, 30ps, 60ps or 90ps.

SDA fine register [7:0] allows fine step of 0.12ps between a ranges from 0 to 30ps

Figure 4-23. SDA Coarse

SDA Coarse allows a variation step of 0, 30ps, 60ps or 90ps.

Figure 4-24. SDA Fine

SDA fine allows a fine step of 0.12ps between a range of 0 to 30ps

So the Sampling Delay adjusts with the 3WSI interface could vary from 0ps up to 120ps with a step of 0.12ps.

Figure 4-25. SA

Note: Functionality is not recommended on this version EV12AS200ZPY. Please contact the hotline for more information.

Application Information

- 5.1 Analogue Input** The analogue input (VIN, VINN) are entered in differential AC coupled mode as described in Figure 4-1.
- It is recommended to use a differential source to drive the analogue inputs of this ADC (external balun or differential amplifier). Please refer to Section [Test Bench Description](#) for more information.
- In order to optimize the performance of the ADC, it is also recommended to use a band pass filter on the analogue input path.

Figure 5-1. Differential Analogue Inputs Implementation

- 5.2 Clock Input** It is recommended to use a differential source to drive the clock input. The clock is AC coupled via 10nF capacitors. Please refer to Section [Test Bench Description](#) for more information.

Figure 5-2. Clock Input Implementation

The jitter performance on the clock is crucial to obtain optimum performance from the ADC. We thus recommend to use a very low phase noise clock and to filter the clock signal if a fixed frequency is used.

5.3 SYNC input

An external LVDS reset (SYNC, SYNCN) is available in case it is necessary to reset the ADC during operation (it is not mandatory to perform an external reset on the ADC for proper operation of the ADC as a power up reset is already implemented). This reset is LVDS compatible. It is active low. It is asynchronous but is re-latched internally to the sampling clock.

Figure 5-3. RESETN Input Implementation

- 5.4 SA, GA, OA, SDA and SDAEN pin Commands** These signals are connected by default via their respective jumper.
Mode_n deactivated: JUMPER OFF for switched SPI towards board.

Figure 5-4. Functionality Deactivated

Jumper: Functionality deactivated -> No variation of voltage range (set to default middle value $2 \times V_{CC3}/3 = 2.2V$)

Figure 5-5. Functionality Activated

Jumper: Functionality activated -> Variation of voltage range with tuneable resistor between $(2 \times V_{CC3}/3 - 0.5V = 1.7V)$ and $(2 \times V_{CC3}/3 + 0.5V = 2.7V)$

Figure 5-6. Functionality Floating

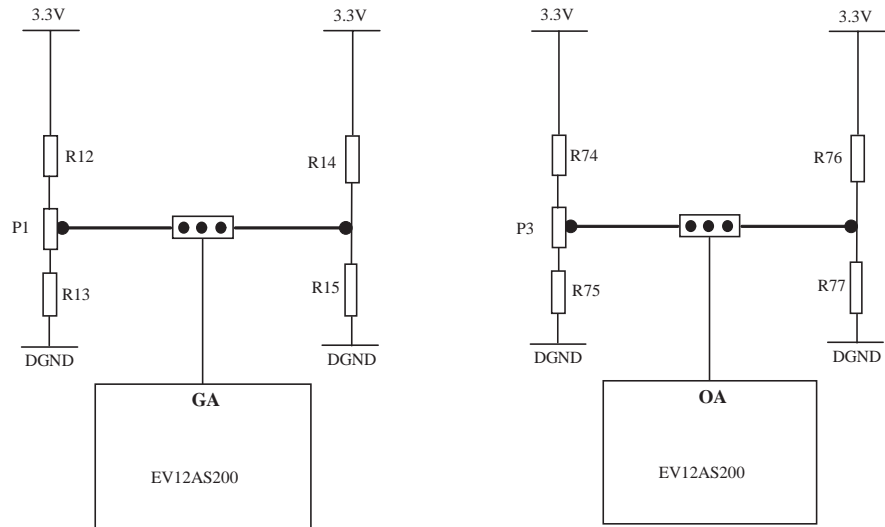

No Jumper: floating voltage = 2.16V

5.4.1 GA and OA Commands

These signals are connected by default via their respective jumper to the command middle value (ie. $2 \times V_{CC3}/3 = 2.2V$). When the jumper is removed, it is possible to tune the OA and GA commands between $(2 \times V_{CC3}/3 - 0.5V)$ to $(2 \times V_{CC3}/3 + 0.5V)$.

Figure 5-7. GA and OA Commands Implementation

With:

$$R12 = R74 = 287\Omega$$

$$R14 = R76 = 649\Omega$$

$$P1 = P3 = 1K$$

$$R13 = R75 = 1.05\text{ k}\Omega$$

$$R15 = R77 = 1.33\text{ k}\Omega$$

5.4.2 SA Command

This signal is connected by default via its jumper to the command middle value (ie. $2 \times V_{CC3}/3 = 2.2V$).

When the jumper is removed, it is possible to tune the SA commands between ($2 \times V_{CC3}/3 - 0.5V$) to ($2 \times V_{CC3}/3 + 0.5V$).

Figure 5-8. SA Command Implementation

With:

$$R16 = 287\Omega$$

$$R18 = 649\Omega$$

$$P2 = 1K$$

$$R17 = 1.05\text{ k}\Omega$$

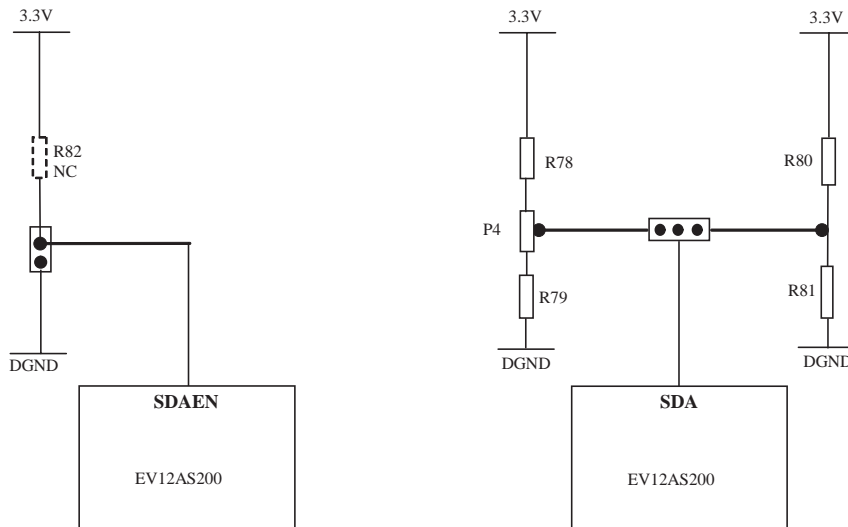

$$R19 = 1.33\text{ k}\Omega$$

Note: Functionality is not recommended on this version (EV12AS200). See with e2v hot line.

5.4.3 SDAEN and SDA Commands

SDAEN signal allows activating the SDA command when its jumper is OUT or connected. When the SDA function is activated via SDAEN, then it is possible to tune the sampling delay of the ADC by tuning the SDA command between $(2 \times V_{CC3}/3 - 0.5V)$ and $(2 \times V_{CC3}/3 + 0.5V)$ by 40 ps around the nominal Aperture delay of the ADC.

Figure 5-9. SDAEN and SDA Commands Implementation

With:

R82 = 10 kΩ (NC: can be connected to provide a true High level to SDAEN)

R78 = 287Ω

R80 = 649Ω

P4 = 1K

R79 = 1.05 kΩ

R81 = 1.33 kΩ

Figure 5-10. SDAEN Command Jumper Settings

SDAEN activated: JUMPER ON

SDAEN inactivated: JUMPER OUT

5.5 RS, TM, and MODE_n Commands

The RS, TM, and MODE_n functions are implemented on board with a jumper which can be ON or OUT (default setting is when the Jumpers are OUT). A 10 kΩ resistor can be connected in case a pull up is necessary to force a high level on these signals. This resistor is not connected.

Figure 5-11. RSx, TMx, and MODE_n, Commands Implementation

- The default setting for RS, TM and MODE_n is when their respective jumper is OUT.

Figure 5-12. RS, TM and MODE_n Command Jumper Settings

5.6 RESETn

The RESETn signal allows reconfiguring ADC to Default Mode.

Figure 5-13. RESETn Command

5.7 Output Data

The digital outputs are compatible with LVDS standard. They are on-board 100 differentially terminated.

Figure 5-14. Differential Digital Outputs Implementation

Double row 2.54 mm pitch connectors are used for the digital output data. The lower row is connected to the signal while the upper row is connected to Ground.

The connectors are vertical connectors.

Figure 5-15. Differential Digital Outputs 2.54 mm Pitch Connector (X = A, B)

Figure 5-16. Differential Digital Outputs 2.54 mm Pitch Connector (Port A)

Figure 5-17. Differential Digital Outputs 2.54 mm Pitch Connector (Port B)

Figure 5-18. Differential Digital Outputs 2.54 mm Pitch Connector (DR, DRN Signal)

Figure 5-19. Differential Digital Outputs 2.54 mm Pitch Connector (PCBa, PCBan, PCBb, PCBbn Signal)

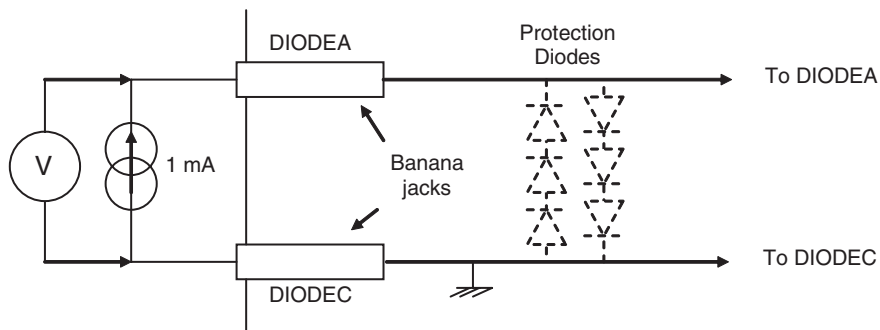

5.8 Diode for Junction Temperature Monitoring

Two 2 mm banana jacks are provided for the die junction temperature monitoring of the ADC.

One banana jack is labeled DIODEA and should be applied a current of up to 1 mA (via a multimeter used in current source mode) and the second one is connected to DIODEC.

Figure 5-20. Die Temperature Monitoring Test Setup

Note: The protection diodes are NC.

Figure 5-21. Die Temperature Monitoring

5.9 Test Bench Description

Figure 5-22. Test Bench Description

■ Equipment

Input Signal Generator: Agilent E4426B or E4424B

Clock Signal Generator: Agilent E4426B or MARCONI 2042

Power Supply: Agilent 6629A

Logic Analyzer: HP16500C

Balun: MACOM-H9 (2MHz => 2GHz)

Band pass filter: LORCH (500MHz => 1GHz) & LORCH (1GHz => 2GHz)
